

The Company

A government owned water infrastructure and asset constructor and owner

Background / Issue

The company runs large multidiscipline infrastructure design and construction projects that requires significant coordination of resources across all the different disciplines. The ability to coordinate these resource requirements is very difficult with no standard approach to project management and the use of inconsistent tools across the divisions.

Solution

Strathdon Consulting developed a standalone tool that took information from the disparate systems and enabled the user to match all resources to all requirements rather than on a project by project basis.

Results

1. Balanced resources across all projects
2. Forward view of potential bottlenecks and resource conflicts
3. Standardised approach to resource planning and priority setting
